THE SIX AGENTS

Each agent has one job, a clear input and output, a point where it asks the human, and one thing it never does

Deal manager

decides who asks

Runs the deal. The master agent.

GETS	The one-line brief and every event.
MAKES	Situation type (1 of 8), playbook, task list, stale marks.
ASKS	When two results disagree, or a task cannot finish.
NEVER	Does the math, or writes a record directly.

Intake agent

E1 E2

Reads the documents.

GETS	Uploaded or cached documents.
MAKES	A fact table: value, page, quote. A list of missing documents.
ASKS	E1 for a missing document. E2 to confirm the facts the plan relies on.
NEVER	Guesses a missing number.

Clause reader

E3

Finds the limits in the loan agreement.

GETS	The agreement text and the fact table.
MAKES	Constraints: clause, exact quote, plain meaning, confidence, defined terms.
ASKS	E3 when a quote or a defined term is unclear.
NEVER	Keeps a quote that the validator cannot find in the document.

Structuring agent

E4

Designs the financing mixes.

GETS	Constraints, target amount, and the objective weights of the situation profile.
MAKES	Candidate mixes of senior, junior, and preferred. A shortlist. A blocked-plan record with the clause and a consent route.
ASKS	E4 when a clause blocks the plan.
NEVER	Invents terms or computes numbers itself. It calls the math tools.

Risk agent

E5

Tests each plan under many futures.

GETS	The shortlist and labeled assumptions (rates, growth, volatility).
MAKES	Monte Carlo results with a run id: odds of a covenant breach, a blocked dividend, a loss.
ASKS	E5 when an event flips the best plan.
NEVER	Reports a number without a seed and a run id.

Memo and approvals agent

E6

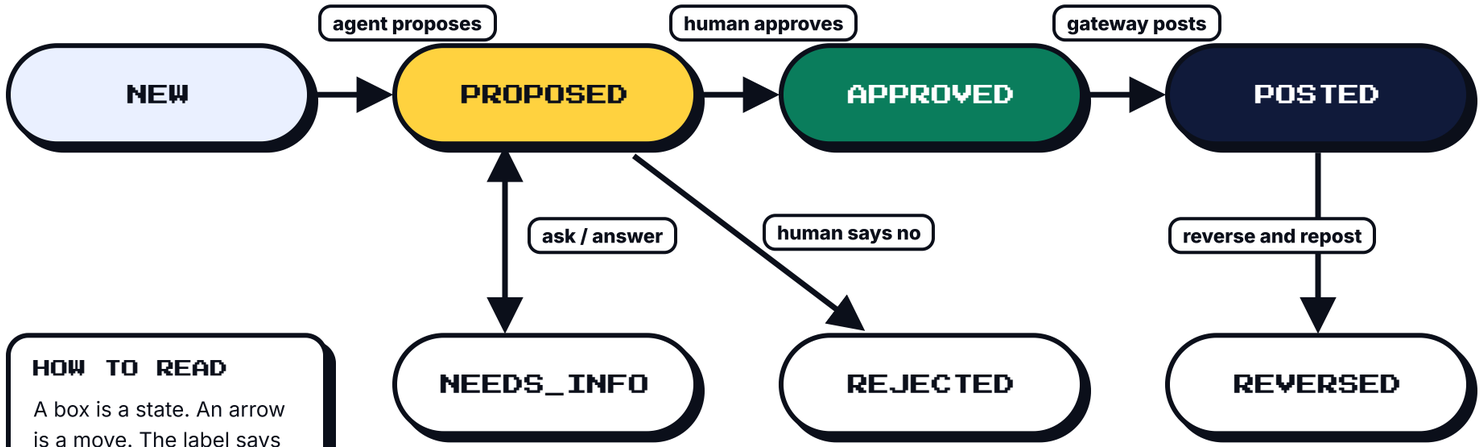

Writes it up and learns from a "no".

GETS	All results, with their citations and run ids.
MAKES	The recommendation, the side-by-side table, and a policy proposal after a rejection.
ASKS	E6 for the final decision.
NEVER	Approves its own work or its own policy.

AI agent · Code (no AI) · Human reviewer · Escalation point

HOW A TASK MOVES

Agents never chat. They pass typed work items. Each item moves through a fixed set of states

HOW TO READ

A box is a state. An arrow is a move. The label says who may make it.

DENIED: THE ACTION IS NOT APPLIED

Any forbidden action is refused and written to the log. Examples: an agent approves its own item, calls a tool it was not given, or posts a number with no run id. A denied attempt is evidence, so it is kept.

Why this matters: the Hyphenate workshop calls this the system of work. Records hold the truth. The system of work holds the tasks, the decisions, the questions, and the log.

WHO CAN DO WHAT

WHO	MAY
AI agent	create, propose, ask a question, call its tools
Human reviewer	answer, approve, reject, override a profile
Gateway (code)	post to the record, write the log

SIX RULES THE GATEWAY ENFORCES

1. Only the gateway posts to the record.
2. The proposer of an item cannot approve it.
3. An agent can call only the tools it was given.
4. Every number carries a run id from the math code.
5. A reversal is a new item linked to the original. Nothing is deleted.
6. Every action and every denied attempt goes in the log. Each log row is chained to the one before.

Agent step · Human step · Code step · Denied

WHAT THE DATABASE HOLDS

Exact facts live in tables. Vectors only help find the right passage. The proposed table names may change in the build

SOURCE
What came in.

document
File, type, hash of the file

document_chunk
Text passage plus a vector, so search can find it

KNOWLEDGE
What we learned from it.

fact
Value, page, exact quote

clause
Quote, plain meaning, confidence, defined terms

WORK
What the agents are doing.

work_item
Type, state, owner, links

plan
Instruments and sizes

simulation_run
Seed, run id, results

LEARNING
What the humans taught it.

decision
Approve or reject, with a reason

precedent
A past deal pattern

policy
Rule, evidence, status

PROOF
What happened, in order.

audit_log
Who, what, the change, and the hash of the row before. Only appended.

forks
Copies of the database to compare plans. Tiger Cloud makes them fast.

HOW ONE FACT TRAVELS (every claim in the memo traces back to the page)

Document
Credit agreement, page 94

>

Fact or clause
Intake or clause reader saves the exact quote

>

Quote check
Code confirms the quote is on that page

>

Plan and run
Math uses the fact. The run gets an id

>

Memo
Each claim links to the run id and the quote

Vectors find, tables decide. Search can help find the paragraph about a debt basket. The number used in a plan always comes from a saved fact with a page and a quote, never from a search guess.

Forks for what-if plans. Each candidate plan can run in its own copy of the database. The reviewer compares them. Approving one merges it. This is the honest fit for the Tiger Data prize (to confirm free-tier limits at the booth).
